

Onda — Trading Signals

How we process partner trading analysis into actionable, Hyperliquid-tradable setups — a concise overview.

Staging report · 2 Oct 2026

The pipeline

Our partner sends trading analysis two ways: **pushed** live over a websocket, and **on-demand** plans we pull on a schedule. Everything flows through one path:

ingest → store raw → **filter to Hyperliquid markets** → complete the take-profit ladder → de-duplicate → **store as a canonical setup** → **monitor live price** → notify (Telegram) → user executes in our UI.

The backend never places orders — it produces and tracks setups; the user trades from our UI, connected to Hyperliquid (all pairs quoted in USDC).

The five signal types we process

Type	Source	What it carries & how we handle it
Filter Mix	pushed	Direction, entry, stop; TPs often missing → we derive them. ~70% arrive with no TPs.
Liquidity Hunt	pushed	Full entry/stop/TPs + confidence (A/A+) and score. Only A/A+ with score ≥ 9 are kept; weaker ones dropped.
Signal Hub	pushed	Indicator alert now carrying entry/stop/TP1; we extend TP2/TP3 from TP1.
Futures Plan	on-demand	Per symbol/timeframe plan with multiple long/short entry <i>zones</i> ; each zone becomes a setup.
Spot Zones	on-demand	Laddered buy/sell accumulation plan (patient entries); stored separately for the UI.

Processing rules (applied to every pushed/on-demand setup):

- **Hyperliquid filter.** Partner quotes in USDT; we normalise to the base coin and keep only coins tradable on Hyperliquid (USDC). Everything else is dropped.
- **Take-profit ladder.** Partner TPs are kept as-is; missing ones are *derived* and clearly tagged. Rule: all given → use them; TP1 only → extend 2×/3×; none but a stop → 2R/4R/6R; nothing → 10/20/30%.
- **De-duplication & supersedence.** Identical re-sends are dropped; near-identical ones (same coin/direction, entry within 0.5%) collapse to the freshest — so the user is alerted once, not spammed.

Partner coverage (live staging data)

We track, per market, whether the partner's on-demand API covers it (it returns an error for coins it doesn't), so we never re-request the unsupported ones.

Market type	Tradable on HL	Partner covers	Not covered
Perpetuals	178	109	69
Spot	313	15	298

Figures from the staging database; every active market has been checked (0 pending). "Tradable on HL" excludes delisted markets (56 perps) that we never query. Coverage is complete and one-time: an unsupported coin is flagged permanently (the partner returns an error for it). Supported coins are re-fetched every 24h to stay fresh, by a job that runs every 30 minutes within the partner's rate limit.

How setups are invalidated & expired

A monitor polls live Hyperliquid prices every few seconds and moves each setup through its lifecycle, waiting for price to reach the entry zone:

- **Entry hit** — price reached the entry zone; the user is notified it's time to enter (and we record the time, for backtesting).

- **Invalidated** — price moved through the stop-loss before ever reaching entry; entering would have been an immediate stop-out, so the setup is no longer valid.
- **Expired** — the setup stayed open for its full validity window (24h) but price never reached entry, so it is closed as no longer actionable.

Invalidated and expired notifications each include a plain-language reason. The "approaching entry" heads-up is intentionally not sent, to keep the channels quiet.

User trading styles

One setup is computed the same for everyone; each user's *settings* shape how it is presented and managed — the setup itself is never changed. The style controls how much of the position is taken at the targets versus left to run:

Style	At the targets	Runner (let it ride)
Conservative	40% / 30% / 30%	none — fully exits at TPs
Balanced (default)	30% / 30% / 20%	20%, with a trailing stop
Aggressive	20% / 20% / 10%	50%, with a trailing stop

Other per-user options: entry style (exact price, zone, or dca-in), and whether to move the stop to breakeven after the first target. **Default** for users who never open settings: **Balanced**, zone entry, move-to-breakeven after TP1, trailing on.

Activity snapshot (staging)

Metric	Value
Raw partner messages ingested	8,705
Distinct setups produced	2,378
Coins with setups	109
Entries reached (price hit the zone)	284
