

Onda — Backtest Report

How our stored trade setups would have performed, replayed on Hyperliquid 1-minute candles.

Window: last 7 days · Position: \$100 margin @ 5x (\$500 notional) · Scale-out = 30/30/20 + 20% runner trailing 5%

At a glance

Two rule-sets are compared for every strategy: **as-traded** (respects our live invalidation + expiry — those become no-trades) and **take-all** (ignore both; enter every setup that reaches its zone). “\$ PnL” totals the profit/loss across all entered trades under each fixed exit target.

Funnel — entered trades per mode

Strategy	Total setups	Entered (AT)	Entered (TA)	Avg TPs (AT)	TP1 win % (AT)
Liquidity Hunt	220	151 (69%)	213 (97%)	1.93	79%
Signal Hub	937	168 (18%)	578 (62%)	0.10	58%
Futures Plan	3959	1231 (31%)	2109 (53%)	0.13	11%
Filter Mix	23	8 (35%)	19 (83%)	1.12	62%

AT = as-traded (respects invalidation/expiry). TA = take-all (ignores both), so many more trades enter. Max concurrent never exceeds the entered count for that mode.

Profitability & capital — as-traded (AT) vs take-all (TA)

Strategy	Best \$ (AT)	Best \$ (TA)	Avg conc. (AT)	Avg conc. (TA)	Max capital (AT)	Max capital (TA)
Liquidity Hunt	TP1 -36	TP1 +215	32.4	44.4	\$10,900	\$13,300
Signal Hub	TP1 +816	TP1 +1,088	32.1	110.4	\$11,500	\$39,200
Futures Plan	TP2 +499	TP2 +72	25.0	42.8	\$9,200	\$13,300
Filter Mix	TP2 +88	TP2 +58	1.8	2.6	\$600	\$800

Best \$ = total PnL under the best fixed exit policy (policy shown). AT = as-traded, TA = take-all. Avg conc. = time-weighted average simultaneously-open positions. Max capital = max simultaneously-open positions × \$100 margin (margin only, no leverage) — what you'd need to follow every trade of that strategy at once. TA concurrency/capital is higher because take-all never time-expires a trade, so many positions stay open to the window end and pile up.

Key takeaways

- **Net-profitable (as-traded, best exit):** Signal Hub (TP1 **+816**), Futures Plan (TP2 **+499**), Filter Mix (TP2 **+88**).
Net-negative: Liquidity Hunt (best TP1 **-36**).
- **Liquidity Hunt — high win rate, negative expectancy.** 79% of trades tag TP1, yet every exit loses (TP1 **-36**, TP2 **-95**, TP3 **-751**): the partner's TP1 sits only a hair above entry while the stop is far below, so the ~21% of trades that hit SL outweigh the many tiny wins. **This strategy needs better targets or a tighter stop before it's tradable.**
- **No single exit target wins everywhere** — the best fixed exit differs by strategy (Liquidity Hunt→TP1, Signal Hub→TP1, Futures Plan→TP2, Filter Mix→TP2). Holding to TP3 is consistently the worst (reversals give the gains back).
- **Signal Hub is the strongest performer** (TP1 **+816**), profitable under every exit — but enters rarely as-traded (168/937; most invalidated/expired first). Take-all enters far more but needs ~\$39,200 of margin.
- **Futures Plan has a low hit rate** (1095 SL vs 96 reaching TP1) — the nearer/weaker zones get stopped; deeper targets (TP2/TP3) recover it to net-positive. Note: these still carried a 24h expiry in this data (1429 expired); the new price-only invalidation will convert many of those into entries.
- **Derived TPs barely matter** — almost all TP hits are partner-set levels (e.g. Futures Plan 141/21 partner/derived); our derived targets sit deeper and rarely get reached, so they neither help nor hurt much.
